

## Think9 AI & Intelligence Challenge

At Think9, we are building 30+ consumer brands simultaneously from the ground up. To scale at this pace, we are building Think9 as an **AI-native learning organization**. Our focus is not just on using AI for isolated tasks, but on building **centralized intelligence layers** that drive speed across every function - from consumer insights and vendor negotiations to organizational decision-making and product development [and go much beyond this – making Think9 and each of our brands AI native].

We are looking for **AI-native thinkers, engineers, and strategists** who can push our thinking on how autonomous agents, fine-tuned models, and intelligent workflows can multiply our execution speed.

## The Assignment

We want to evaluate how you approach complex systems, scale, and organizational speed.

**Your Task:** Pitch an agentic framework, AI system, or workflow that can be deployed centrally across Think9's 30+ brands to solve a critical business bottleneck or radically improve our operational speed.

You can either **pitch your own original idea** based on where you see the biggest opportunity, or **choose one of the sample tracks below** to develop further.

## Sample Tracks (For Inspiration)

If you don't have a specific idea in mind, choose one of the following domains to build out:

### 1. Central Consumer Intelligence Engine

- *Problem:* Market research is usually static, slow, and reactive.
- *Challenge:* Design an autonomous system that continuously ingests global trends, social signals, ingredients, and consumer behaviors to proactively push actionable insights tailored to the Indian market.

### 2. Cross-Portfolio Supply Chain & Sourcing Agent

- *Problem:* Procurement across 30+ brands creates operational friction and misses volume-bundling opportunities.

- *Challenge:* Blueprint an AI agent layer that processes unstructured vendor data (quotes, MOQs, lead times, PDFs/chats) to optimize sourcing and flag supply risks across brands.

### 3. "Decision Velocity" & Institutional Memory

- *Problem:* As brand portfolios grow, institutional knowledge gets fragmented and decision-making slows down.
- *Challenge:* Design the architecture for a centralized "Think9 Brain" that ingests internal meeting notes, legal playbooks, and brand histories to instantly answer operational queries and speed up daily execution.

### 4. 10x Content & Creative Intelligence Engine

- *Problem:* Producing brand assets, packaging mockups, and performance ad variations across 30+ brands requires immense manual effort.
- *Challenge:* Formulate an AI-driven creative pipeline that scales visual and copy generation while maintaining strict brand identity and consistency.

### 5. Autonomous Customer Feedback & Product Quality Hub

- *Problem:* Tracking consumer sentiment across thousands of reviews, support chats, and social channels is hard to aggregate centrally.
- *Challenge:* Conceptualize a pipeline that ingests raw customer feedback across all brands, automatically categorizes issues, and alerts product/brand teams to urgent fixes or growth hooks.

## What We Expect in Your Submission

Regardless of whether you pitch your own idea or choose a sample track, your submission should include:

- **The Problem & Opportunity:** Clear breakdown of the bottleneck and why an agentic/AI solution is required.
- **System Architecture & Workflow:** How the system functions, including data sources, agent logic, and human-in-the-loop checkpoints.
- **Proof of Concept / Prototype:** A working script, demo, no-code build, or detailed step-by-step framework demonstrating execution.

- **Implementation Plan:** A high-level tech stack and a 30-day roadmap to build a minimum viable version of your system at Think9.

### **Submission Details**

- **Format:** Slide deck (PDF), architecture document, video walkthrough, or code/prototype repository link.
- **Deadline:** Wednesday, 12<sup>th</sup> August
- **How to Submit:** Reply directly to this email with your submission attached or linked.
